

Orionid Systems

Capability statement. IT consultancy for state and local agencies, federal agencies and prime contractors, and regulated commercial clients: AI, data engineering, database migration, and cybersecurity and compliance.

Core capabilities

Artificial intelligence. Practical AI for regulated settings: use-case review, search and assistants built on your own documents, and the governance records that go with them.

Data engineering. Pipelines, warehouses, and data quality checks on cloud platforms, documented so your staff can run them after we leave.

Database migration. Moves between database engines or hosting environments, planned around your cutover window and tested before it happens.

Cybersecurity and compliance. Control mapping, gap assessments, and evidence collection against the frameworks you answer to. We support your authorization or audit; we do not issue it.

Other IT projects. Cloud migration, systems integration, and contact center platform work. If the project has a clear scope, ask.

Fixed-scope offers

Compliance gap assessment. Control-by-control comparison against one framework you choose, a ranked remediation list, and a compliance matrix filled in for your system.

Database migration readiness assessment. Inventory, dependency map, recommended approach, cutover and rollback plan, and a written estimate.

AI use-case and risk review. Risk rating and recommended controls for each candidate use, and a go or no-go memo.

Data pipeline pilot. One source-to-report pipeline in your cloud account, with data quality checks, documentation, and a handover session.

How we work

1. We agree the scope in writing.
2. We map the work to the controls you are assessed against.
3. We hand over evidence you can file.
